  Warning items given below are to avoid danger to user’s body and life and avoid the damage or deterioration of the product. Use the product, observing the following warning and caution items.

- **Warning items on power supply**
  - **Power supply voltage**
    The rated power supply voltages of the product are 100, 120, 220 and 230VAC. The rated power supply voltage for each product should be confirmed by reading the label attached on the back of the product or by the “rated” column shown in the instruction manual. The specification of power cord attached to the products is rated to 125VAC for all products which are designed to be used in the areas where commercial power supply voltage is not higher than 125VAC. Accordingly, you must change the power cord if you want to use the product at the power supply voltage higher than 125VAC. If you use the product without changing power cord to 250VAC rated one, electric shock or fire may be caused. When you used the product equipped with power supply voltage switching system, please refer to the corresponding chapter in the instruction manuals of each product.

  - **Power cord**
    (IMPORTANT) The attached power cord set can be used for this device only.
    If the attached power cord is damaged, stop using the product and call us or your local dealer. If the power cord is used without the damage being removed, an electric shock or fire may be caused.

  - **Protective fuse**
    If an input protective fuse is blown, the product does not operate. For a product with external fuse holder, the fuse may be replaced. As for how to replace the fuse, refer to the corresponding chapter in the instruction manual. If no fuse replacement procedures are indicated, the user is not permitted to replace it. In such case, keep the case closed and consult us or your local dealer. If the fuse is incorrectly replaced, a fire may occur.
USING THE PRODUCT SAFELY

■ Warning item on Grounding
If the product has the GND terminal on the front or rear panel surface, be sure to ground the product to safely use it.

■ Warnings on Installation environment
● Operating temperature and humidity
Use the product within the operating temperature indicated in the “rating” temperature column. If the product is used with the vents of the product blocked or in high ambient temperatures, a fire may occur.
Use the product within the operating humidity indicated in the “rating” humidity column. Watch out for condensation by a sharp humidity change such as transfer to a room with a different humidity. Also, do not operate the product with wet hands. Otherwise, an electric shock or fire may occur.
● Use in gas
Use in and around a place where an inflammable or explosive gas or steam is generated or stored may result in an explosion and fire. Do not operate the product in such an environment.
Also, use in and around a place where a corrosive gas is generated or spreading causes a serious damage to the product. Do not operate the product in such an environment.
● Installation place
Avoid installing the product on inclined places or on places subject to vibration. Otherwise, the product may slip or fall down to cause damages or injury accidents.

■ Do not let foreign matter in
Do not insert metal and inflammable materials into the product from its vent and spill water on it. Otherwise, electric shock or fire may occur.

■ Warning item on abnormality while in use
In abnormal situations, such as “smoke”, “fire”, “abnormal smell” or “irregular noise” occur from the product while in use, stop using the product, turn off the switch, and remove the power cord plug from the outlet. After confirming that no other devices catch fire, ask us or your local dealer.
USING THE PRODUCT SAFELY

■ Input / Output terminals
Maximum input to terminal is specified to prevent the product from being damaged. Do not supply input, exceeding the specifications that are indicated in the "Rating" column in the instruction manual of the product. Also, do not supply power to the output terminals from the outside. Otherwise, a product failure is caused.

■ Calibration
Although the performance and specifications of the product are checked under strict quality control during shipment from the factory, they may be deviated more or less by deterioration of parts due to their aging or others. It is recommended to periodically calibrate the product so that it is used with its performance and specifications stable. For consultation about the product calibration, ask us or your local dealer.

■ Daily Maintenance
When you clean off the dirt of the product covers, panels, and knobs, avoid solvents such as thinner and benzene. Otherwise, the paint may peel off or resin surface may be affected.
To wipe off the covers, panels, and knobs, use a soft cloth with neutral detergent in it. During cleaning, be careful that water, detergent, or other foreign matters do not get into the product.
If a liquid or metal gets into the product, an electric shock and fire are caused. During cleaning, remove the power cord plug from the outlet.

Use the product correctly and safely, observing the above warning and caution items. Because the instruction manual indicates caution items even in individual items, observe those caution items to correctly use the product.

1 INTRODUCTION

1-1 Overview
The AG-205 provides a convenient solution for low frequency (10Hz ~ 1MHz) signal generation, specifically for audio bandwidth. Intuitive and simple panel interface provides quick frequency and amplitude adjustment, with dial/key shortcuts to different ranges. Square wave generation covers digital application in addition to the traditional analog using sine wave. Distortion is kept at minimum level, especially at the audible frequency range: 0.02% or less distortion factor for 500Hz~20kHz. The external synchronization signal input helps collaborating with other measurement devices.

1-2 Features
● Low sine wave distortion,
● High stability, shorter warm-up time and less power consumption
● Compact styling with vertical type panel for easy operation.
● Frequency dial scale calibrated with single-scale graduations for frequency range from 10Hz to 1MHz selectable in 5 ranges.
● Low output impedance of 600Ω
● High output design; more then 5Vrms at 600Ω
● Output level is fully adjustable with a 10dB-step, 6 range attenuator and a level adjuster
● The attenuator provides accuracy of ± 1.0dB at 600Ω
● Sine and square waves easily available
● External Synchronizing input terminal.
2 FRONT AND REAR PANELS

2-1 Front Panel

① Frequency Dial
This dial adjusts oscillating frequencies. Frequencies can be read by multiplying the reading on the dial scale by magnification of FREQ. RANGE.

$$10 \times \frac{\text{Dial value}}{100} = 1\text{kHz}$$

② Attenuator
6-position output attenuator selects attenuations of 0dB to -50dB in 10dB steps.
③ Output Terminal
Output terminal used for both sine wave and square wave. Output impedance is 600Ω.

④ Power Switch
This switch applies or removes AC power. Power indicator lights when POWER switch is ON.

⑤ Amplitude Knob
Amplitude adjuster to continuously vary the amplitude of output voltage.

⑥ Waveform Selector
Output waveform selector switch. It toggles between sine wave (闲置) and square wave (有源).

⑦ Frequency Selector
Oscillating frequency range selector switch which selects the ranges in 5 steps.

② Press the power switch and the pilot lamp will light indicating that the unit is ready for operation. Allow 2 or 3 minutes for the unit to warm up so that it is stabilized.

2 Waveform Selection

① Connect output terminal and DUT with output cable.

② Press the WAVE FORM switch to select sine waves or square waves.

3 Frequency Selection

① First set the FREQ. RANGE switch to the desired range.

② Set the frequency dial so that the dial pointer indicates your frequency.

4 Adjustment of Output Voltage

① Turn the Attenuator knob to select the attenuation rate.

② Turn the Amplitude knob to fine tune the amplitude.

Note

- Because of the use of direct coupled circuits throughout the entire stage, a DC voltage will appear at OUTPUT terminal for a while when the power is on. This DC voltage will disappear about 20 to 30 seconds later when normal output waveform is obtained.

- A thermistor is used to control the oscillating voltage. Care should be used when operating instrument in atmosphere of excessive temperature variation because the thermistor is normally affected by ambient temperature variation.

- Be sure to press only one FREQ. RANGE switch. If two switches are pressed at the same time or all the switches are in released positions, your instrument will not work properly.

- Excessive noise from an outside source may affect the external synchronizing input terminal. If such a noise is evident, short this terminal (output voltage amplitude will somewhat deviate in this case)

- Even if the frequency adjustment dial is set to the same scale, it may cause a mechanically shifted by a direction turning.
3-2 Use of Synchronizing Input Terminal

By applying an external sine wave signal to SYNC terminal the oscillating frequency of instrument can be synchronized to the external signal. The synchronizing range is increased in proportion as the input voltage is increased as shown in Fig below.

Input voltage: 1Hz ~ 1MHz, 10V rms or less
synchronizing range is about ± 1 % per input voltage of 1V rms

![Diagram showing synchronizing range vs input voltage](image)

**Note**
- Too high a synchronizing signal voltage will affect the amplitude and distortion factor, and care must therefore be taken when the signal voltage is higher than 3V rms.
- If the synchronizing signal is largely deviated from the frequency of instrument, the synchronization is pulled out which affects the distortion factor. It is therefore advisable that the oscillating frequency be first synchronized with a low input signal voltage (less than 1V rms) and then the voltage be increased.
3-3 Application (Measurement of Phase Characteristic)

Connect the instrument and an oscilloscope to the amplifier to be tested as shown in figure below (DUT: amplifier)

If there is no phase shift about the output signal of the amplifier, the oscilloscope will display a straight line as shown on the right Fig.

If the straight line on the oscilloscope is curved at its top and bottom sections as shown on the right Fig., it indicates that the output signal of amplifier is suffering from an amplitude distortion.
In this case, reduce the output level of instrument a little to vary the frequency. This causes the straight line on the oscilloscope to expand gradually to turn into an ellipse. By utilizing the configuration of this ellipse, the phase shift can be calculated as follows:

Measure the maximum horizontal deflection and suppose that this deflection is \( x \), and that the section at which the ellipse crosses the horizontal axis is \( x \) as shown in fig. below.

And, the phase shift angle \( \theta \) is given by the following:

\[
\sin \theta = \frac{x}{X}
\]

Find \( \theta \) from the table of trigonometric functions and the value obtained gives the angle of phase shift.
### 4 SPECIFICATIONS

The following specifications temperature: 23°C ± 5°C, Humidity: 50% or less of the environment and the power supply ON after leaving the instrument for more than 24 hours, will be applied to a case in which was aged for 30 minutes or more.
